

Local Development Portal (LDP)

Togo mockup with synthetic data - AI agent work report

Repository: e3tools/local-development-portal | Branch: agentic-LDP | Report date: 4 October 2026

Prepared by: Claude Code (AI agent), session for Leonardo Gutierrez

Deliverable	Status	Where
Navigable portal mockup (8 modules, 455 static pages)	Done, builds clean	Repo root, branch agentic-LDP
Synthetic Togo dataset (Savanes, Kara, Centrale)	Done, seeded and deterministic	src/data/*.ts
Vercel deployment	Ready; needs a 2-minute import by a human	README.md
Draft brief: AI chat for development partners	Done (v0.1)	planning-docs/ai-chat-for-development-partners-brief.md
This report	Done	planning-docs/ldp-togo-mockup-work-report.pdf

Scope note: the portal is a clickable mockup. Every village, person, amount and grievance is generated from a fixed seed. The real administrative names used (regions, prefectures, cantons) are indicative only. No backend, no database, no environment variables.

1. Summary

The request was to deploy a Vercel version of the Local Development Portal with mock data from Togo. The repository contained only a README and a list of design links (Adobe XD and Miro), so the agent built the portal from scratch as a Next.js application, generated a Togo-specific synthetic dataset, verified the production build with screenshots, and pushed it to a new branch named **agentic-LDP** as requested.

Direct deployment from the agent session was not possible: the Vercel API host is blocked by the session's network policy and no Vercel token was available. The branch is configured so that importing it in Vercel with default settings deploys it without further changes.

A second request produced a draft product brief for an AI chat layer that lets development partners query the portal data in plain language. It is stored in the planning-docs directory.

Timeline of requests

#	Request	Outcome
1	Deploy a Vercel version of this with mockup data from Togo	Portal built, verified, pushed. Vercel import left to the user (network block).
2	Create a new branch called agentic LDP	Branch agentic-LDP created and used for all pushes (spaces not allowed in git branch names).
3	Draft brief for an AI chat so partners can speak with the data	Markdown brief written, committed and pushed under planning-docs/.
4	PDF report of the work with screenshots	This document.

Headline numbers

Metric	Value
Modules implemented	8 (dashboard, territorial profiles, priorities registry, investment packages, GRM, partners, capacity building, users)
Static pages generated at build	455
Regions / prefectures / cantons / villages	3 / 16 / 67 / 211
Local priorities / sub-projects / grievances	633 / 163 / 96
Partners / users / training resources	10 / 15 / 12
Commits from this session on agentic-LDP	2 (19a27a9 portal mockup, efc093a AI chat brief); other sessions have since added CI deploy, galleries and an AI token budget
Build, lint and type-check	All passing (Next.js 16.3, TypeScript, ESLint)

2. What was built

Stack

- Next.js 16 (App Router) with React 19 and TypeScript; every route is prerendered with generateStaticParams, so the site is 100 % static and needs no server-side runtime.
- Tailwind CSS 4 with a small design-token layer (brand green, ink greys, status colours). System font stack, no external font fetch at build time.
- No database, no API, no environment variables. Data modules are plain TypeScript computed at build time from a seeded pseudo-random generator, so output is identical on every build and between server and client.
- Charts are hand-written HTML/SVG (horizontal bars, 100 % stacked distributions, sparkline, heat-map matrix) following a validated colour palette; every chart has a legend or direct labels and hover tooltips.

Modules and routes

Design module (from 'Design Links and Resources')	Route(s)	What the page shows
Dashboard (consolidated)	/	8 KPI tiles, priorities by sector, sub-project status mix, budget by region, grievances per month, regional coverage table, latest packages
Village profile	/territoires/villages/[id]	Demography, vulnerability index, GPS, infrastructure, CVD committee, priorities, sub-projects, linked grievances
Canton profile	/territoires/cantons/[id]	Governance (chief, CCD, PDC), priorities by sector, access to services, road access, village table, sub-projects, grievances
Region overview	/territoires, /territoires/regions/[id]	Prefecture and canton tree, partners active in the region, vulnerability averages
Investment / local priorities registry	/priorites	Filterable registry (region, sector, status, rank, search, sort) with cost, beneficiaries and votes
Investment package: approval flow	/investissements, /investissements/[id]	Pipeline by approval step, filterable list, per-package timeline CVD > CCD > commune > region > UCP > financing, documents checklist
GRM customization dashboard	/grm	Open vs resolved, SLA breaches, satisfaction, by category / channel / status / region, filterable case list, sensitive cases masked
Competitive view: partners and positions	/partenaires	Region x sector investment-position heat map, commitments per partner, partner directory
Capacity-building interfaces	/renforcement	Training catalogue with completion rates, offline availability, local languages
User management and approval roles	/utilisateurs	Accounts, roles, scope, 2FA, status; role x module permission matrix

Synthetic dataset design

The dataset targets the three COSO project regions in northern Togo. Prefecture and canton names are real; village names are generated from Togolese-sounding syllables so that no real locality is mislabelled. Person names are drawn from common Togolese first and last names.

Entity	How it is generated	Volume
Regions, prefectures, cantons	Hand-listed (Savanes, Kara, Centrale; 16 prefectures; 67 cantons) with chief, CCD committee and PDC flag	3 / 16 / 67
Villages	2 to 4 per canton; population, households, infrastructure, CVD, displaced households, vulnerability score derived from infrastructure gaps	211
Local priorities	3 per village (rank 1 to 3) across 9 sectors with cost ranges per sector, source (village assembly, women / youth focus groups) and status	633
Investment packages	Derived from financed or PDC-integrated priorities; 6-step approval flow with actors, dates and comments; progress, disbursement, HIMO jobs, contractor	163
Grievances	8 categories, 6 channels, 4 escalation levels, SLA by severity; sensitive VBG cases anonymised; open cases dated in the last 60 days	96
Partners	10 real institution names with fictional region x sector positions and commitments	10
Users and roles	7 roles, 15 accounts, permission matrix over 6 modules	15
Training resources	12 items with audience, duration, languages and completion	12

Quality checks performed

- TypeScript type-check and ESLint pass; production build generates all 455 pages without warnings.
- Every page rendered in headless Chromium after the build; zero console or page errors.
- Visual review of the dashboard, village profile, investment detail and partner matrix; two layout fixes applied (definition lists, grievance dating) and re-verified.
- Locale-independent number and date formatting to avoid server/client hydration mismatches.

3. Platform screenshots

Captured from the production build (next build + next start) at 1440 px width on 4 October 2026. Long list pages are shown above the fold only.

Figure 1. Dashboard: KPI tiles, priorities by sector, sub-project status, grievances per month, regional coverage and latest packages.

Figure 2. Territorial navigation: region cards with prefecture and canton chips, sub-project counts per canton.

Figure 3. Region Savanes: KPIs, priorities by sector, partners active in the region, prefecture and canton table (above the fold).

Figure 4. Canton profile (Nano): governance, priorities, access to basic services, road access, village table, sub-projects and grievances.

Figure 5. Village profile: identity, infrastructure, CVD committee, ranked local priorities, sub-projects and linked grievances.

Figure 6. Local priorities registry with filters (region, sector, status, rank), search and sorting (above the fold).

Figure 7. Investment packages: pipeline by approval step and filterable list with progress and current step (above the fold).

Figure 8. Investment package detail: six-step approval circuit with actors, dates and comments, document checklist, linked grievances.

Figure 9. Grievance redress dashboard: open vs resolved, SLA breaches, satisfaction, breakdowns and filterable case list (above the fold).

Figure 10. Partners view: region x sector investment-position heat map (above the fold).

Figure 11. Capacity-building catalogue with completion rates, audiences and languages.

4. Deployment to Vercel

Why it was not deployed from the session

- Outbound calls to `api.vercel.com` are rejected by the session's network policy (HTTP 403 from the proxy).
- No Vercel token exists in the environment, so even with network access the agent could not authenticate.

Steps for the user (about two minutes)

- Open `vercel.com/new` and import the GitHub repository `e3tools/local-development-portal`.
- Select the branch `agentic-LDP` (or set it as the Production Branch under Settings > Git).
- Keep the defaults: Framework = Next.js, Root Directory = /, no environment variables. Click Deploy.
- Alternative: install the Vercel CLI and run `'vercel --prod'` from a checkout of the branch.

Local commands

Command	Purpose
<code>npm install</code>	Install dependencies
<code>npm run dev</code>	Local development server on port 3000
<code>npm run build</code>	Production build; prerenders all pages
<code>npm run lint</code>	ESLint

5. Draft brief: AI chat for development partners

Stored at `planning-docs/ai-chat-for-development-partners-brief.md` (draft v0.1). Key points:

- **Problem.** Partners have read access but still email the UCP for figures; the UCP answers by hand.
- **Proposal.** A chat panel in the portal that answers plain-language questions (French or English) from live portal data, with figures and links back to the source pages. Read-only.
- **Architecture recommendation.** Tool calling over a typed, role-scoped query API rather than text-to-SQL or RAG, so every number is produced by tested code and access rules live in the data layer, not in the prompt.
- **Guardrails.** Sensitive GRM records, complainant identities and user data never leave the database layer; a golden set of 50 questions is run before each release; answers carry a data-date disclaimer.
- **Pilot.** 8 weeks with 3 partners; targets: 60 % of data requests self-served, 90 % answer accuracy on spot checks, median answer under 20 seconds, zero sensitive-data incidents.
- **Decisions needed.** Data source for v1 (mock vs production replica), ownership of answer accuracy, written data-residency approval before sending aggregates to a model API, whether partners may see each other's positions, and languages beyond FR/EN.

6. Assumptions, limitations and next steps

Assumptions made by the agent

- UI language is French, matching the end users in Togo; the design documents themselves are in English.
- The two Miro boards (approval flow, GRM flow) were not shared with the agent's account, so the approval circuit and GRM levels follow standard COSO practice. If the boards differ, the steps are defined in one place (`src/data/investments.ts` and `src/data/grm.ts`) and can be aligned quickly.
- The portal is single-tenant and has no authentication; the logged-in user shown in the header is static.

Known limitations of the mockup

- Buttons such as 'Valider l'etape', 'Exporter' and '+ Nouvelle priorite' are visual only.
- No map component; GPS coordinates are shown as text.
- List pages cap the priorities table at 150 rows for readability.
- Light theme only.

Suggested next steps

- Import the branch in Vercel and share the preview URL with stakeholders for feedback.
- Share the Miro boards so the approval and GRM flows can be matched exactly.
- Decide on the AI chat brief's five open questions; the query API in that plan can be built against the mock data first.
- If the mockup is adopted, replace the data modules with an API client against COSO-MIS while keeping the pages unchanged.
