

Local Development Portal

A working prototype for the Togo team to pilot

Prepared by: Leonardo Gutierrez **AI Generated**

October 2026

In one line

We turned the Local Development Portal designs into a working, clickable prototype filled with realistic Togo demonstration data, and delivered it in a dedicated branch of the open-source project so the Togo team can pilot it, react to it, and tell us what to change before anything is built for real.

What was delivered	Where it lives
The prototype portal: 8 modules, fully navigable, with demonstration data for the Savanes, Kara and Centrale regions	Branch agentic-LDP of the open-source project repository
A draft concept note for an AI assistant that lets development partners ask questions of the portal data in plain language	Same branch, planning-docs folder
This report	Same branch, planning-docs folder

1. The concept

Local development in the COSO regions runs on information that today sits in separate places: village diagnostics in field notebooks, priority lists in canton plans, investment files in UCP folders, complaints in registers, and partner activities in each partner's own reports. The portal brings these into one place and connects them, so that a priority expressed in a village assembly can be followed all the way to a funded, built and monitored sub-project, and so that every actor sees the same picture.

The prototype follows the module list from the design package (village and canton profiles, priorities registry, investment package approval flow, grievance dashboard, partner view, capacity building, user management) and makes it real enough to click through end to end.

Why a prototype with demonstration data

- Design files show screens; a prototype shows how the screens connect. Reviewers can follow one village from its profile to its priorities, to the sub-project that funds one of them, to the complaints raised about it.
- Realistic numbers make the review concrete. Reviewers argue about whether a vulnerability score of 61 makes sense, not about lorem ipsum.
- It is cheap to change. Nothing is wired to real systems yet, so feedback from the pilot can reshape modules before any integration work starts.

How to read the data in the screenshots

Regions, prefectures and canton names are real. Village names, people, amounts, dates and complaints are generated and fictional. The volumes are chosen to feel like a live system: 3 regions, 16 prefectures, 67 cantons, about 210 villages, more than 600 registered priorities, about 160 investment packages at different stages, and about 100 complaints.

What the pilot should answer

- Do the modules match how the Togo team actually works, from village assembly to UCP approval?
- Are the approval steps, roles and grievance levels the right ones, in the right order?
- What is missing, and what is in the prototype that nobody would use?
- Is the French wording the wording the field teams use?

2. The prototype, module by module

Screenshots are from the delivered prototype. Each module is described by who uses it and what it lets them do.

Dashboard

For whom: UCP management, regional coordinators, partners.

- One screen with the state of the whole programme: villages profiled, population covered, priorities registered, sub-projects by stage, budget committed and disbursed, complaints open and resolved.
- Breakdowns by sector and by region, and a feed of the latest investment packages submitted.

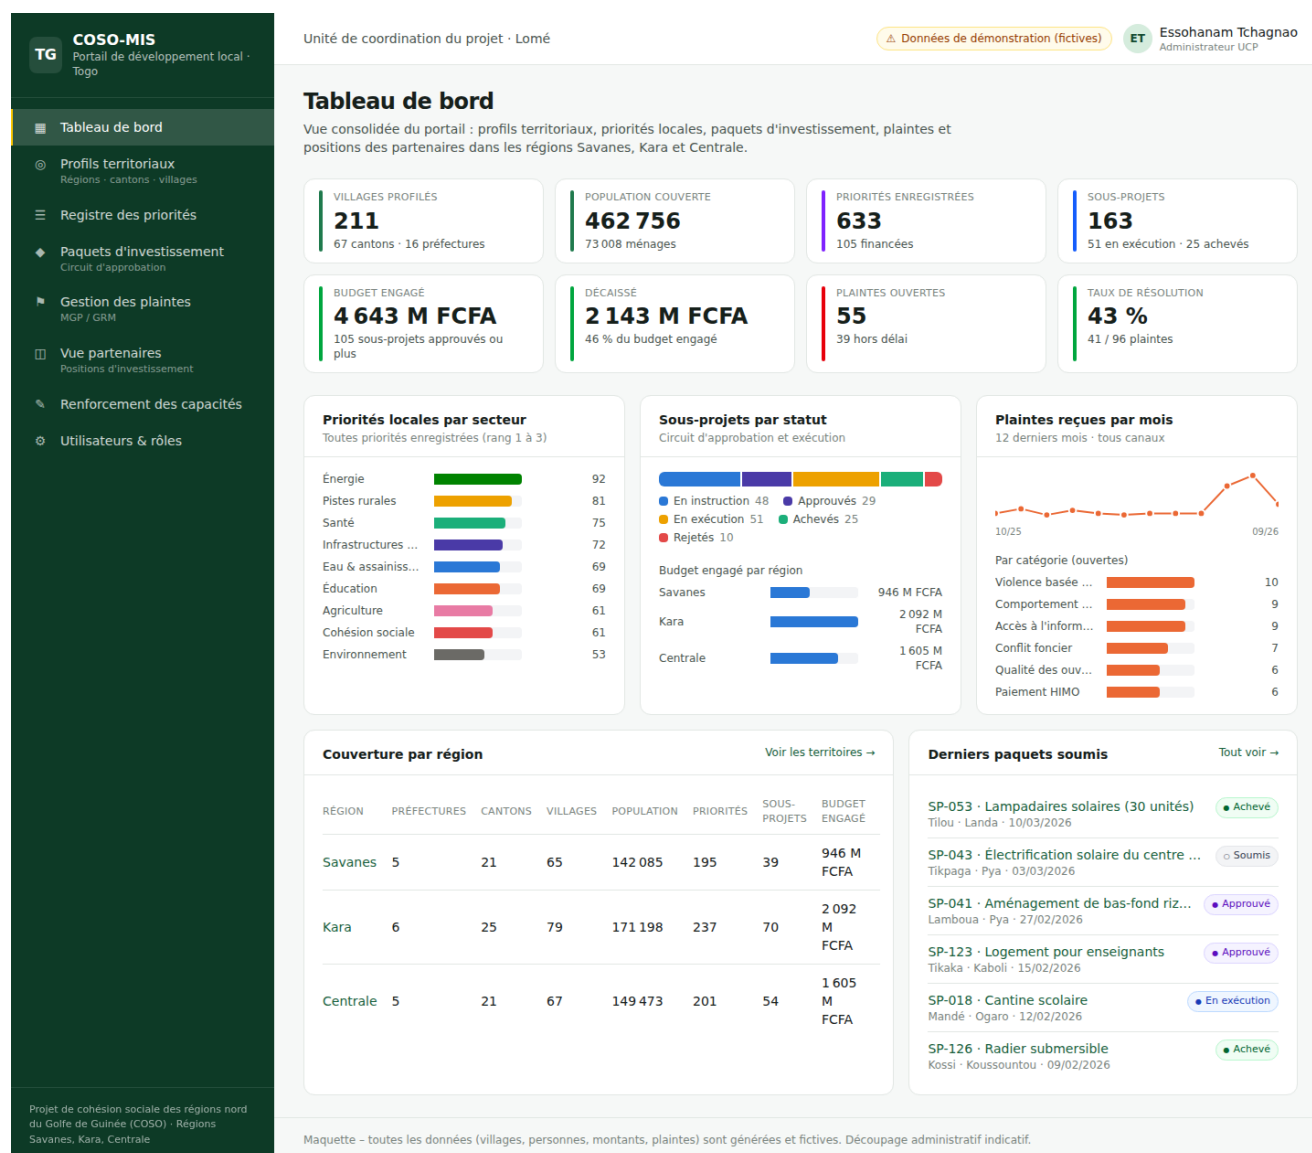

Figure 1. Dashboard with programme-wide indicators and breakdowns by sector, region and status.

Territorial profiles: region, canton, village

For whom: Field agents and canton facilitators (who fill them in), CCD and commune focal points (who use them), partners (who consult them).

- Navigation from region to prefecture to canton to village, with a profile at each level.

- Village profile: population and households, distance to the canton seat, social groups and livelihoods, infrastructure (school, health post, water points, market, electricity, road access), the village development committee (CVD) and its gender balance, a vulnerability index, and the village's ranked priorities, sub-projects and complaints.
- Canton profile: chief and canton development committee (CCD), whether a canton development plan exists, aggregated access to services across the canton's villages, and a comparison table of all villages.

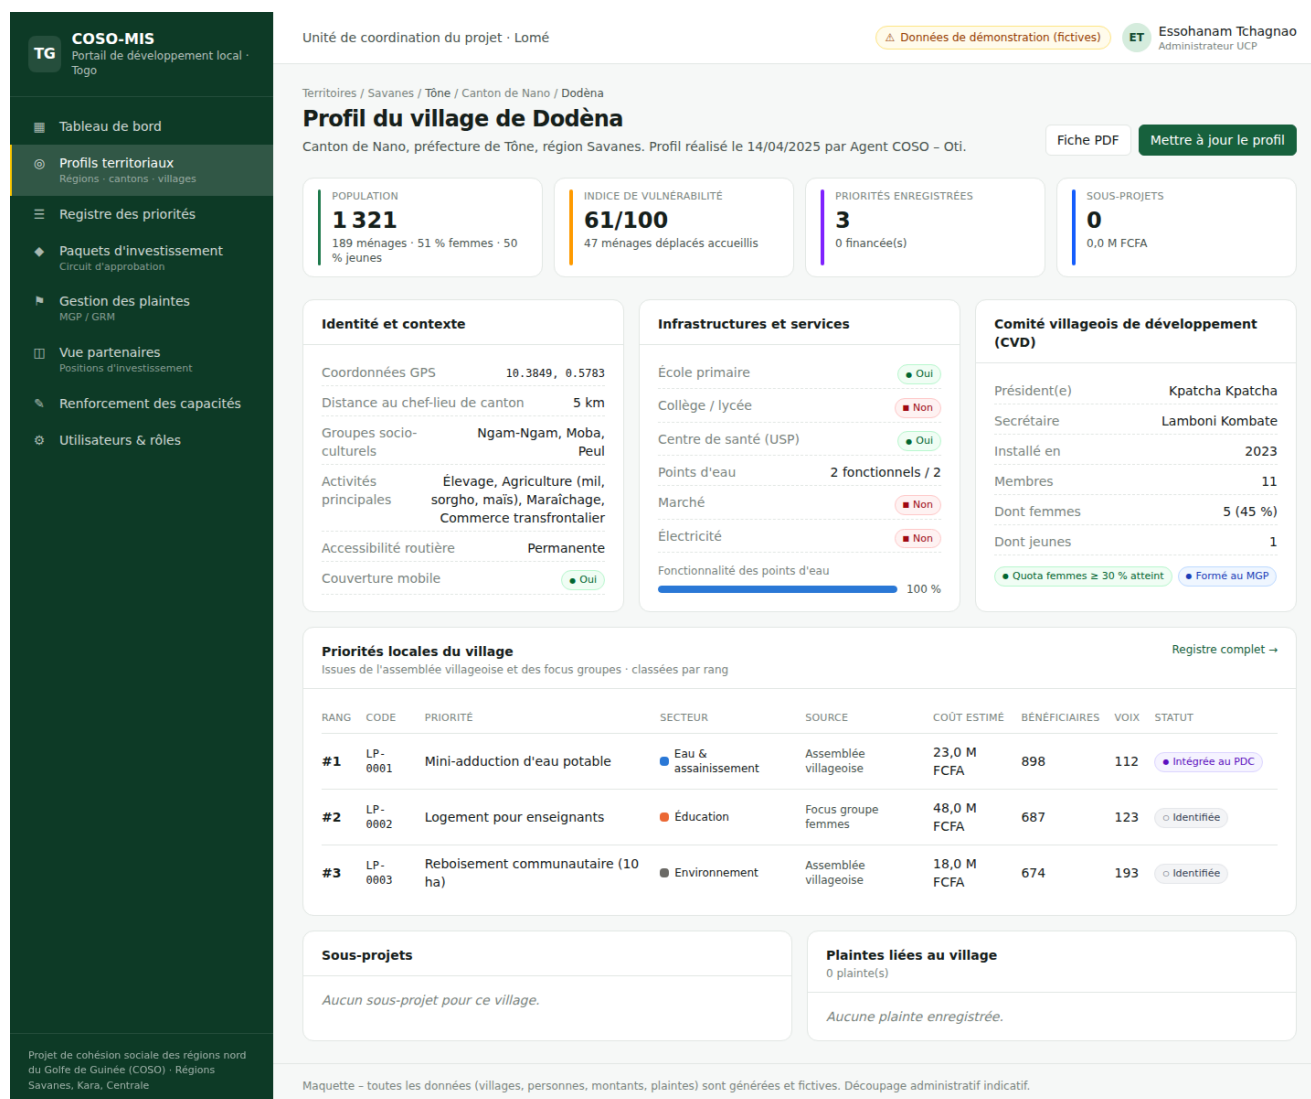

Figure 2. Village profile: identity, infrastructure, committee, ranked priorities and linked sub-projects and complaints.

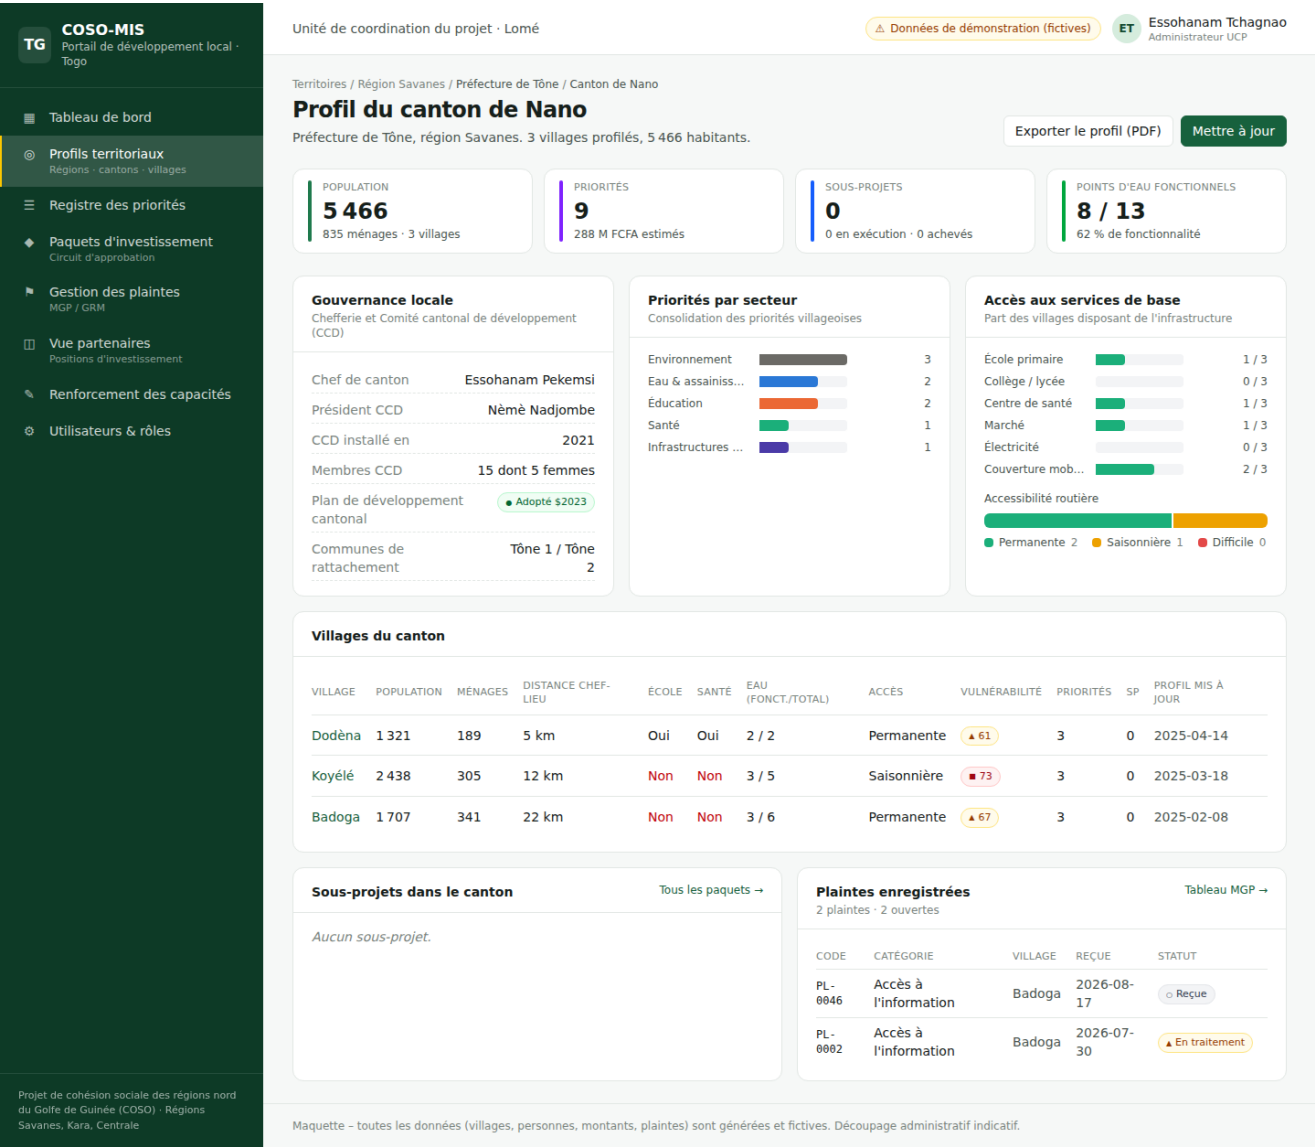

Figure 3. Canton profile: governance, access to services, village comparison, sub-projects and complaints.

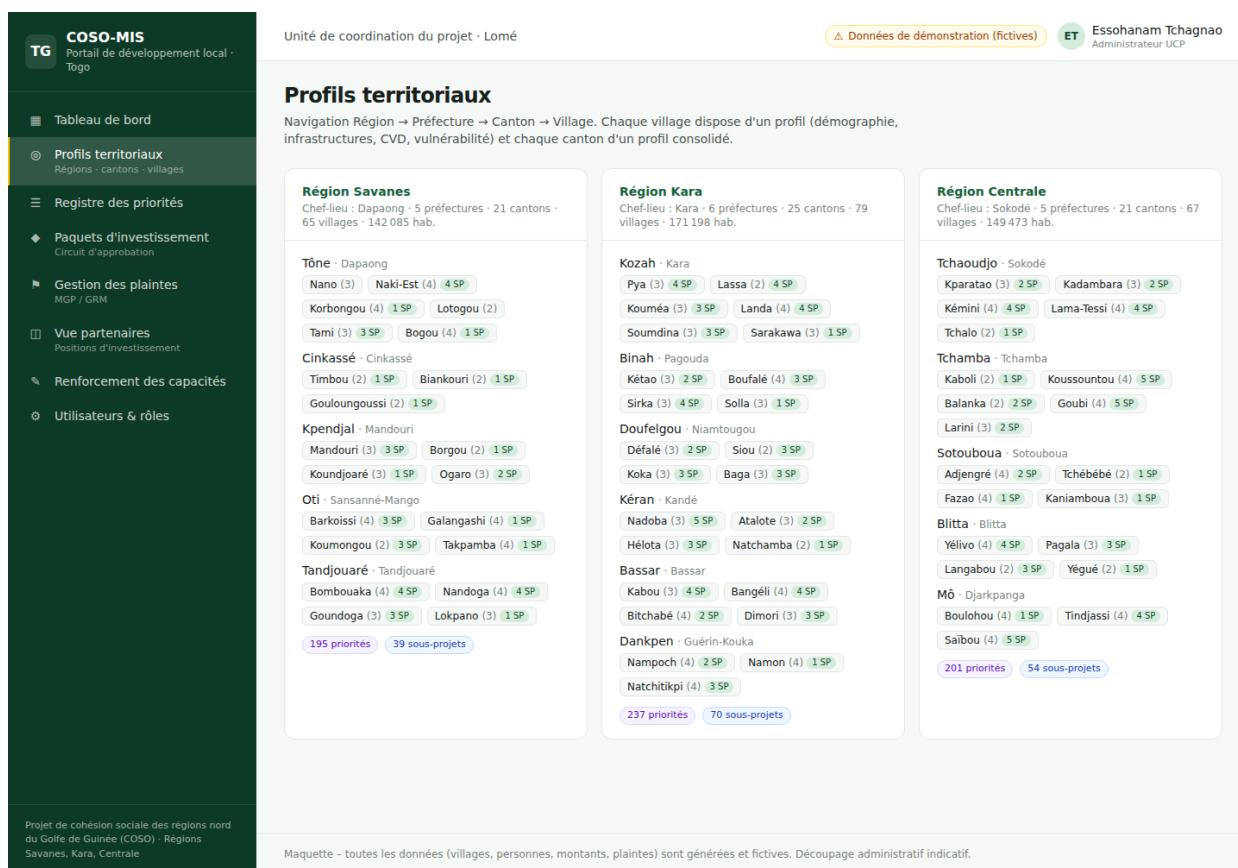

Figure 4. Territorial navigation: the three regions with their prefectures and cantons.

Registry of local priorities

For whom: Communities (through CVD and facilitators), CCD, commune focal points, UCP planning.

- Every need expressed in a village assembly or in a women's or youth focus group is registered once, ranked, costed and tracked through validation by the CCD, integration into the canton plan, and funding.
- Filters by region, sector, status and rank; search; sorting by votes or cost. A running total shows the cost of what is still unfunded.
- This registry is the single source that feeds canton plans, investment packages and the partner view.

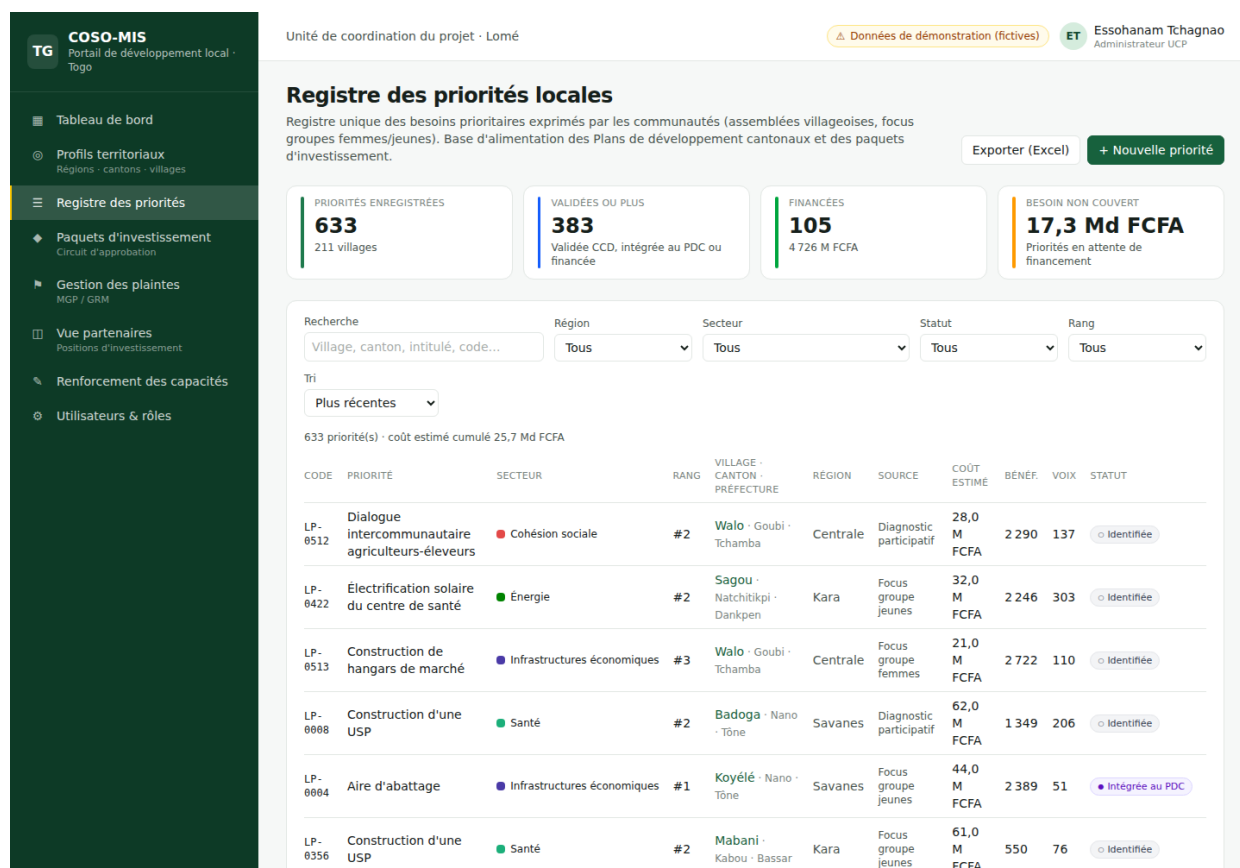

Figure 5. Priorities registry with filters and the cumulative cost of the selection.

Investment packages and the approval circuit

For whom: CVD (submit), CCD (validate), commune focal point, regional coordinator, UCP (approve and finance), contractors.

- A sub-project is created from a registered priority and moves through six approval steps. Each step records who acted, when, and any comment. Rejections are explicit and visible.
- Once approved, the package tracks the contractor, physical progress, disbursement, beneficiaries (with the share of women) and labour-intensive jobs created.
- The list view shows where every package sits in the circuit and who is expected to act next.

Reque

Maquette - toutes les données (villages, personnes, montants, plaintes) sont générées et fictives. Découpage administratif indicatif.

Figure 6. An investment package: the approval circuit with actors, dates and comments, the document checklist and linked complaints.

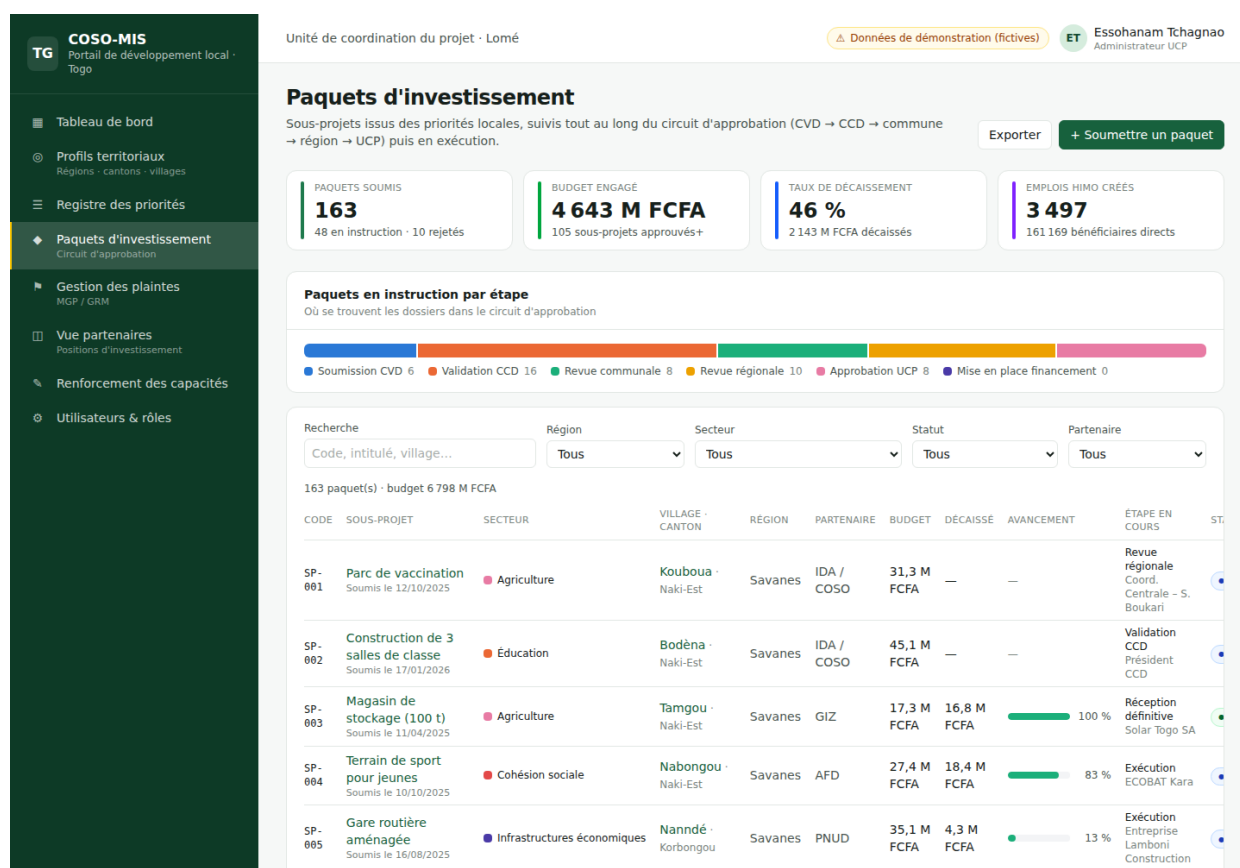

Figure 7. All investment packages: pipeline by approval step and the filterable list.

Grievance management (MGP)

For whom: Village grievance committees, commune focal points, regional safeguards specialists, the UCP grievance unit.

- Complaints arrive through several channels (toll-free number, complaint boxes, committees, mobile app, in person, WhatsApp) and are tracked through receipt, admissibility, treatment, escalation and closure, across four levels from village to UCP.
- Each complaint has a response deadline based on its severity; overdue cases are flagged. Satisfaction is recorded at closure.
- Sensitive complaints (gender-based violence, exploitation, harassment) are anonymised and routed to the specialist, and their content is hidden from the general view.

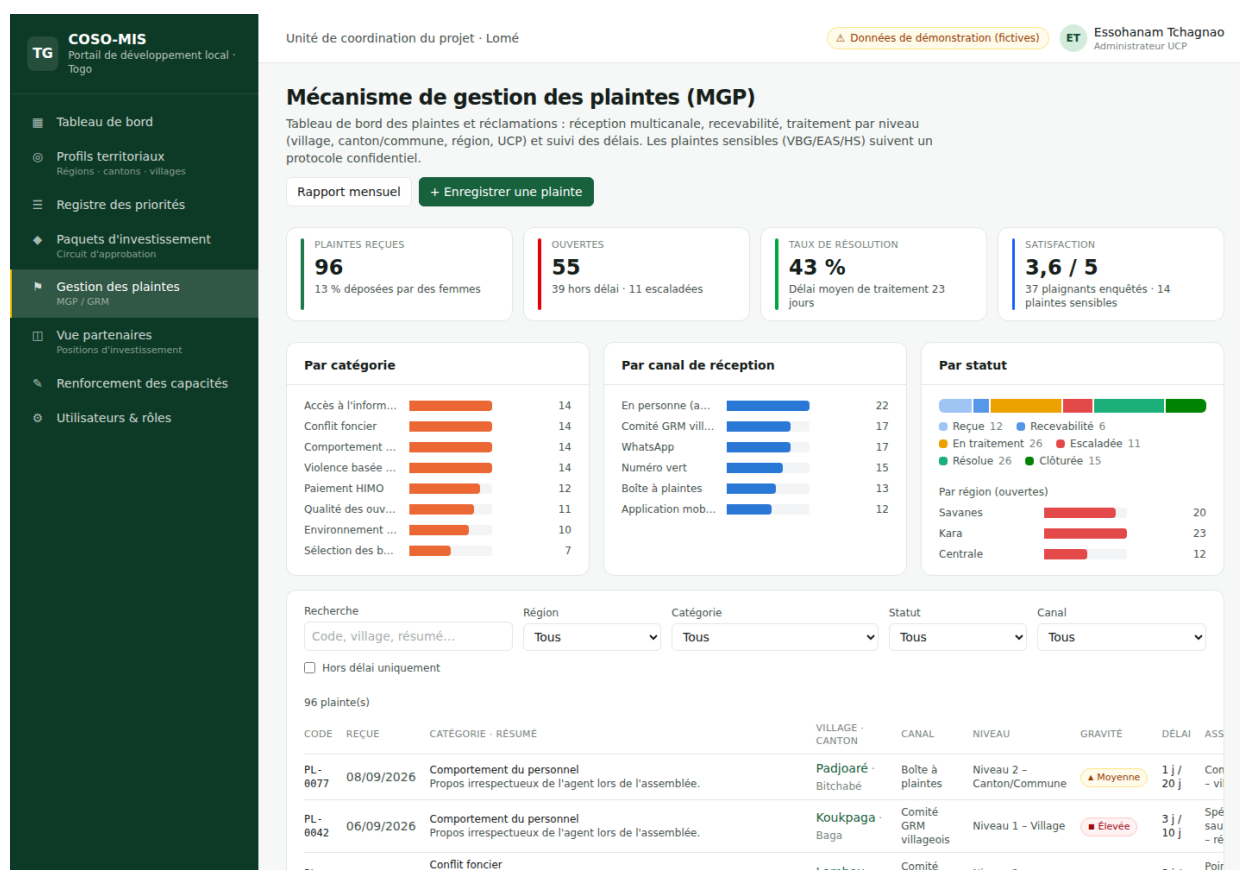

Figure 8. Grievance dashboard: volumes, deadlines, breakdowns by category and channel, and the case list.

Partner view and investment positions

For whom: UCP coordination, regional coordinators, development partners.

- A matrix of who is investing in which sector in which region, with amounts, so that gaps and overlaps are visible at a glance.
- Empty cells are the point: a sector with no partner in a region, next to the registry's unfunded priorities, tells coordination where to direct the next conversation.

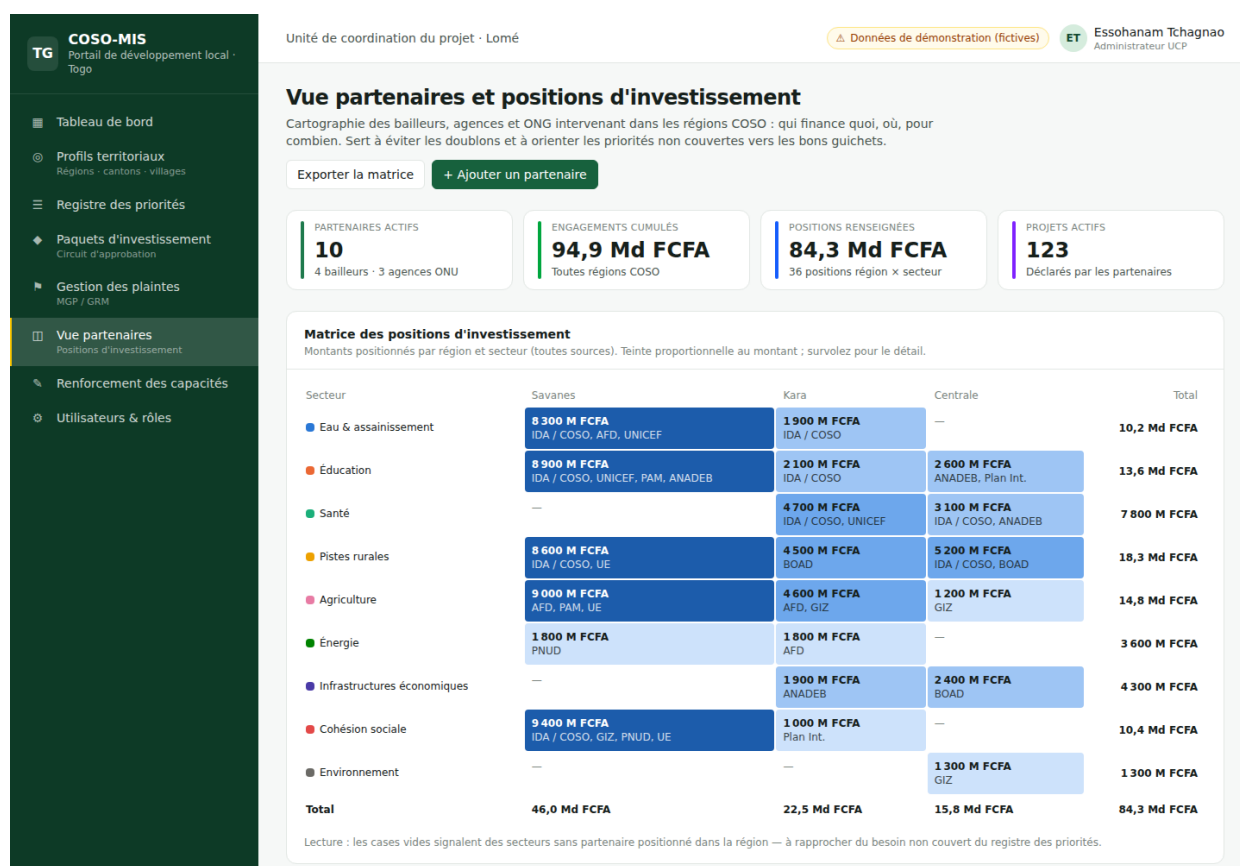

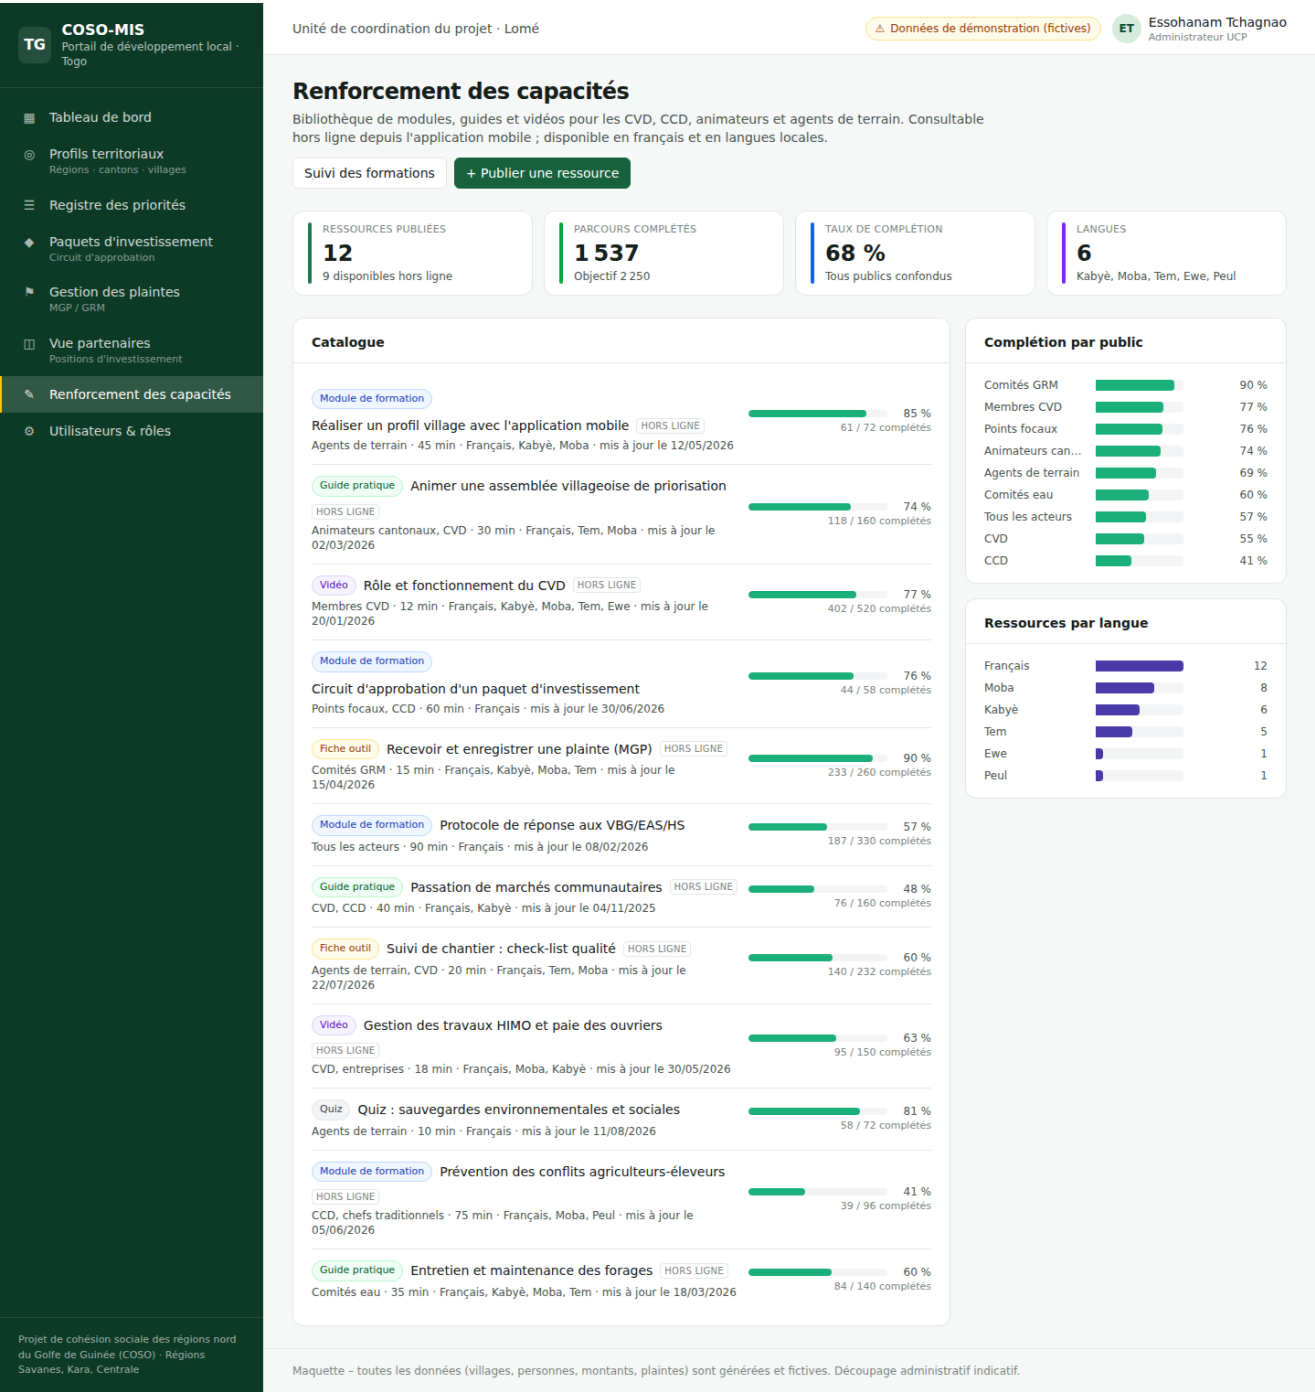

Figure 9. Partner investment positions by region and sector; empty cells show uncovered areas.

Capacity building

For whom: CVD and CCD members, facilitators, field agents.

- A library of training modules, practical guides, videos and tools, available offline and in local languages where recorded.
- Completion is tracked per resource and per audience, so the programme can see who has been trained on what.

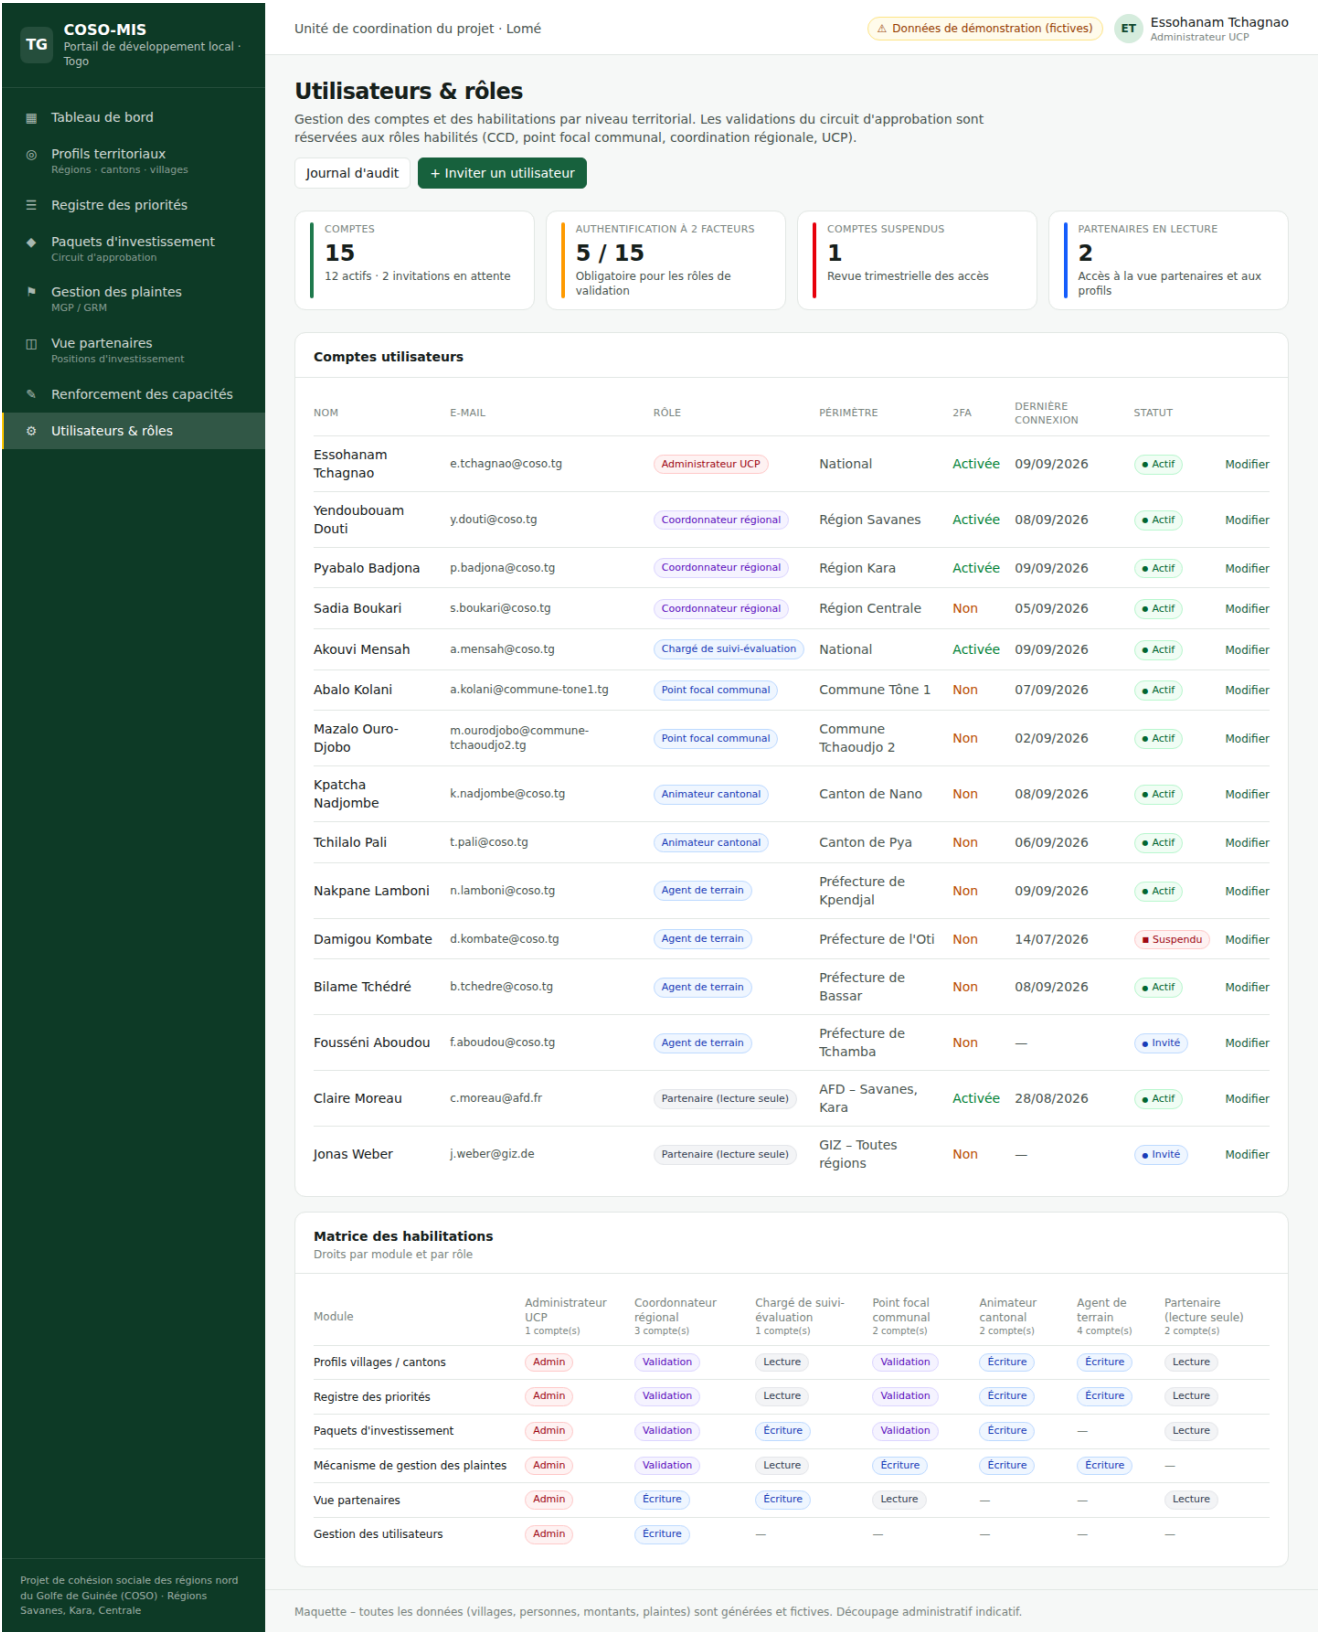

Figure 11. Users, roles and the permission matrix.

3. Next idea: an assistant partners can ask questions to

Development partners already have read access to the portal, yet in practice they email the UCP for numbers and the UCP answers by hand. The concept note delivered with the prototype proposes a conversational assistant inside the portal: a partner asks, in French or English, something like 'Which water priorities validated by the CCD in Savanes have no funding partner?' and gets the answer computed from the portal's own data, with the figures and links to the pages they came from.

- Read-only: the assistant answers questions; it never creates or approves anything.
- Every number comes from the portal's data, and every answer links to its sources, so a partner can verify before quoting it.
- Sensitive complaints, complainant identities and user accounts are excluded by design.
- Proposed as an eight-week pilot with three partners, measured on how many data requests they can answer without involving the UCP.

The note lists the decisions needed before building it, including who owns the accuracy of answers and whether sending aggregated figures to an external AI service is acceptable under the project's data rules.

4. Piloting the prototype

What the Togo team receives

- The prototype, delivered in the **agentic-LDP** branch of the open-source project. It can be opened as a website for reviewers; the team's technical contact has the short instructions.
- The concept note for the partner assistant and this report, in the same branch.

Suggested way to run the pilot

- Walk through one village end to end: profile, priorities, the funded sub-project, its approval history, its complaints. Note everything that does not match reality.
- Have each role (facilitator, CCD member, commune focal point, regional coordinator, UCP) review the module they would use daily.
- Compare the approval circuit and the grievance levels with the team's own flowcharts; these were built from standard practice because the original flowcharts were not accessible to us.
- Collect feedback in one list: keep, change, remove, missing. That list drives the next version.

What we need back

- Confirmation or correction of the approval steps, roles and grievance levels.
- The French terms the field teams actually use for each concept.
- Whether every partner should see every other partner's positions, as the prototype assumes.
- A go or no-go on the partner assistant concept, and answers to its open questions.

What the prototype is not

- It is not connected to any real system or database; all data is demonstration data.
- Action buttons (validate, export, create) are visual only; no data can be changed through the screens yet.
- There is no login; the user shown in the header is a placeholder.
- It has no map; locations are shown as coordinates.
